Recycling Detectives

Before approaching the trash problem in your community, you must know where to put your everyday waste. Prepare for a fun competition!

1. Form communities. Research in a book or online the different types of recycling and what items can and cannot be recycled.
2. Ask for permission to use two trash cans, one for things you can recycle and the other for things you can't recycle. Collect trash from your classroom and around the school; ask for permission if necessary. The objective of the competition is to put the different items in their corresponding category.
3. For every object a community puts in the correct can, they will earn one point.

Rodrigo Gael Martínez Zúñiga, CIUDAD DE MÉXICO

4. The community that finishes first with the most points will be the winner.
5. Don't forget to put into to practice the new vocabulary words you learned.
6. Now that you have identified which objects can and can't be recycled, in classroom community, discuss how to share this new information with the people from your community, and how to remember each category at home.

Reading

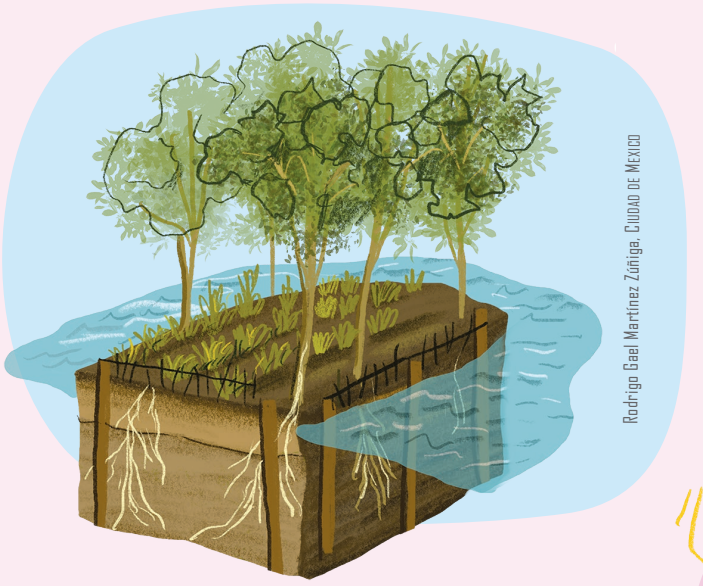

1. Individually, considering everyone else, read the following text:

Agricultural Techniques of Ancient Mexico

Milpa (Crop-field)

This agricultural technique was used more than 2,600 years *ago*. It was practiced by cultures such as Maya, Aztec, Zapotec, and other Mesoamerican cultures.
It consisted of the simultaneous cultivation of corn, beans, and zucchini on the same plot of land. This technique was sustainable because the corn provided nutrients for the beans, while the zucchini covered the soil and kept humidity

Chinampas

There were artificial islands built in the lakes and lagoons of the region with mud, vegetation, and reeds. These islands were used to grow a variety of food, including corn, beans, and chili. They were an ingenious system that took advantage of aquatic resources for agricultural production.

Sun-Drying

It was mainly used with corn after harvest. Corn was left under the sun to dry to reduce its moisture content. This was achieved by spreading it in sunny, well-ventilated areas. It also protected the corn from mold and fungi infections.
